## JOINS

**By : HIRA NOMAN**

# EQUI-JOIN FORMATION THROUGH NATURAL JOIN

- The SQL NATURAL JOIN is a type of EQUI JOIN and is structured in such a way that, columns with the same name of associated tables will **appear once only**.
- NATURAL JOIN creates an implicit join clause for you based on the common columns in the two tables being joined.

## Guidelines:

- The associated tables have one or more pairs of identically named columns.
- The columns must be the same data type.
- The common column should also have the same name in the joining tables.
- No qualifiers can be used with the common column, if Natural Join keyword is used to form the join.

The screenshot shows a SQL query execution window with the following SQL statement: `Select ename,deptno, dname from emp Natural Join dept;`

The results are displayed in a table with columns: ENAME, DEPTNO, and DNAME. The results show 14 rows of data, representing the natural join of the EMP and DEPT tables.
